

PRACTICAL # 2

Write a program that read marks of five subject, calculate the total marks, percentage and state whether candidate is pass or fail.

```
#include <stdio.h>

int main() {
    float sub1, sub2, sub3, sub4, sub5, total, percentage;

    // Input marks of five subjects
    printf("Enter marks of five subjects: ");
    scanf("%f %f %f %f %f", &sub1, &sub2, &sub3, &sub4, &sub5);

    // Calculate total and percentage
    total = sub1 + sub2 + sub3 + sub4 + sub5;
    percentage = (total / 500) * 100;

    // Display results
    printf("\nTotal Marks = %.2f", total);
    printf("\nPercentage = %.2f%%", percentage);

    // Determine pass or fail
    if (percentage >= 40)
        printf("\nResult: Pass\n");
    else
        printf("\nResult: Fail\n");

    return 0;
}
```

```
Enter marks of five subjects: 98 91 88 78 82

Total Marks = 437.00
Percentage = 87.40%
Result: Pass

-----
Process exited after 13.94 seconds with return value 0
Press any key to continue . . .
```

Algorithm

1. Start
2. Declare variables to store marks of five subjects, total marks, and percentage

3. Ask the user to enter marks of five subjects
4. Read and store the entered marks
5. Calculate the total marks obtained
6. Calculate the percentage based on the total marks
7. Display the total marks and percentage
8. Check if the percentage is greater than or equal to the passing marks
9. If yes, display that the candidate has passed
10. Otherwise, display that the candidate has failed
11. Stop
