

Practical # 11

Write a program which print a text of four lines consisting of characters, integer and floating point values using printf() statement and escape

```
#include <stdio.h>

int main() {
    char name[] = "Ahmed";
    int age = 20;
    float marks = 88.5;
    char grade = 'A';

    printf("Name:\t%s\n", name);
    printf("Age:\t%d\n", age);
    printf("Marks:\t%.2f\n", marks);
    printf("Grade:\t%c\n", grade);

    return 0;
}
```

sequence.

```
Name:    Ahmed
Age:     20
Marks:   88.50
Grade:   A
```

Algorithm:

1. Start
2. Declare variables for name (string), age (integer), marks (float), and grade (character)
3. Use printf() with escape sequences (\n for new line, \t for tab)
4. Print name in the first line
5. Print age in the second line
6. Print marks in the third line
7. Print grade in the fourth line
8. End
