

Practical # 12

Write a program which uses Switch and break statements.

```
1  #include <stdio.h>
2
3  int main() {
4      int choice;
5
6      printf("1. Addition\n2. Subtraction\n3. Multiplication\n");
7      printf("Enter your choice: ");
8      scanf("%d", &choice);
9
10     switch (choice) {
11         case 1:
12             printf("You selected Addition.\n");
13             break;
14         case 2:
15             printf("You selected Subtraction.\n");
16             break;
17         case 3:
18             printf("You selected Multiplication.\n");
19             break;
20         default:
21             printf("Invalid choice.\n");
22     }
23
24     return 0;
25 }
```

```
1. Addition
2. Subtraction
3. Multiplication
Enter your choice: 1
You selected Addition.
```

Algorithm:

1. Start
2. Declare an integer variable for user choice
3. Display menu options
4. Read the user's choice
5. Use a switch statement to compare the choice
6. Execute the matching case statement
7. Use break to exit the switch block

8. Display a message for an invalid choice using default
9. End
