

Practical # 13

Write a program using nested for loop to print the following output .

```
1  #include <stdio.h>
2
3  int main() {
4      float basic, medical, conveyance, houseRent, gpFund;
5      float grossPay, netPay;
6
7      // Input basic pay
8      printf("Enter basic pay of employee: ");
9      scanf("%f", &basic);
10
11     // Calculate allowances
12     medical = 0.15 * basic;
13     conveyance = 0.20 * basic;
14     houseRent = 0.45 * basic;
15     gpFund = 0.07 * basic;
16
17     // Calculate gross and net pay
18     grossPay = basic + medical + conveyance + houseRent;
19     netPay = grossPay - gpFund;
20
21     // Display results
22     printf("Medical Allowance: %.2f\n", medical);
23     printf("Conveyance Allowance: %.2f\n", conveyance);
24     printf("House Rent: %.2f\n", houseRent);
25     printf("GP Fund Deduction: %.2f\n", gpFund);
26     printf("Gross Pay: %.2f\n", grossPay);
27     printf("Net Pay: %.2f\n", netPay);
28
29     return 0;
30 }
```

```
Enter basic pay of employee: 29999
Medical Allowance: 4499.85
Conveyance Allowance: 5999.80
House Rent: 13499.55
GP Fund Deduction: 2099.93
Gross Pay: 53998.20
Net Pay: 51898.27
```

Algorithm:

1. Start
2. Declare floating-point variables for basic pay, allowances, deductions, gross pay, and net pay
3. Read the basic pay from the user
4. Calculate medical allowance = 15% of basic pay
5. Calculate conveyance allowance = 20% of basic pay
6. Calculate house rent = 45% of basic pay

7. Calculate GP fund deduction = 7% of basic pay
8. Calculate gross pay = basic pay + medical + conveyance + house rent
9. Calculate net pay = gross pay - GP fund
10. Display all allowances, deduction, gross pay, and net pay
11. End
